Agenda

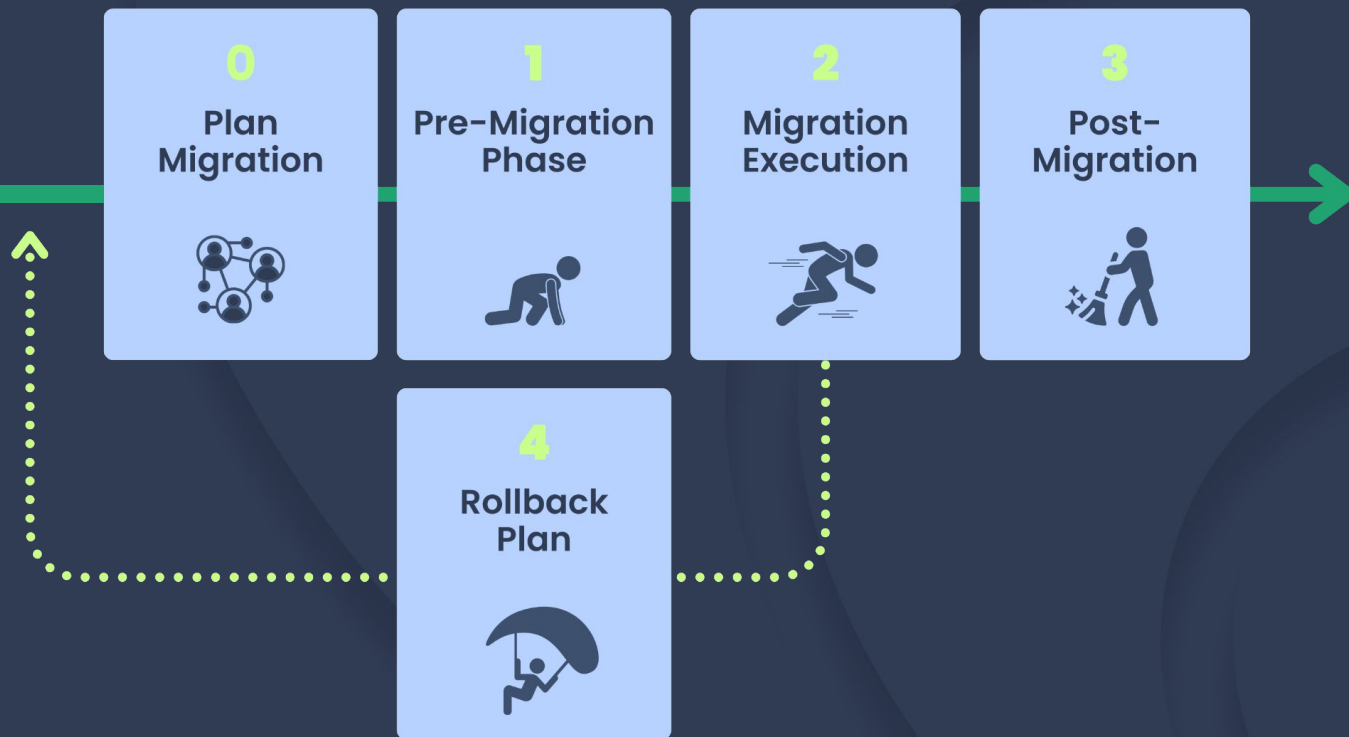

Today's Talk

- How to iteratively draft a migration plan
- Talk is structured like a migration plan

Five Phases of a Successful Migration

0. Plan Migration

0. Plan Migration

Set the scope for this migration.

Make a migration assessment.

Clarify external timeline.

Identify relevant stakeholders.

When done → Call this scaffold “v0.1”
and make sure to get the Migration Plan v0.1 approved.

1. Pre-Migration Phase

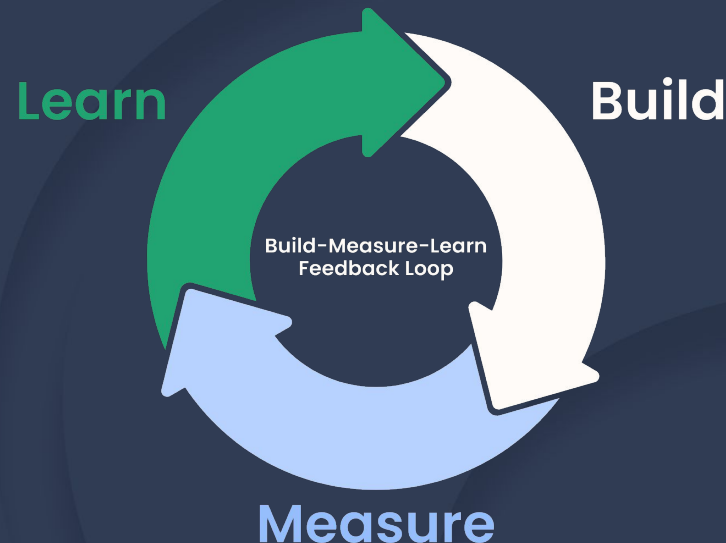

1. Pre-migration Phase

The Goal?

- ✓ Reduce downtime window by doing as much as possible before or after the actual migration.
- ✓ Produce actual migration.

How?

- ✓ "Migrate" the old production environment to a **staging** environment.
- ✓ Staging environment is as close as possible to the new production environment.

Build

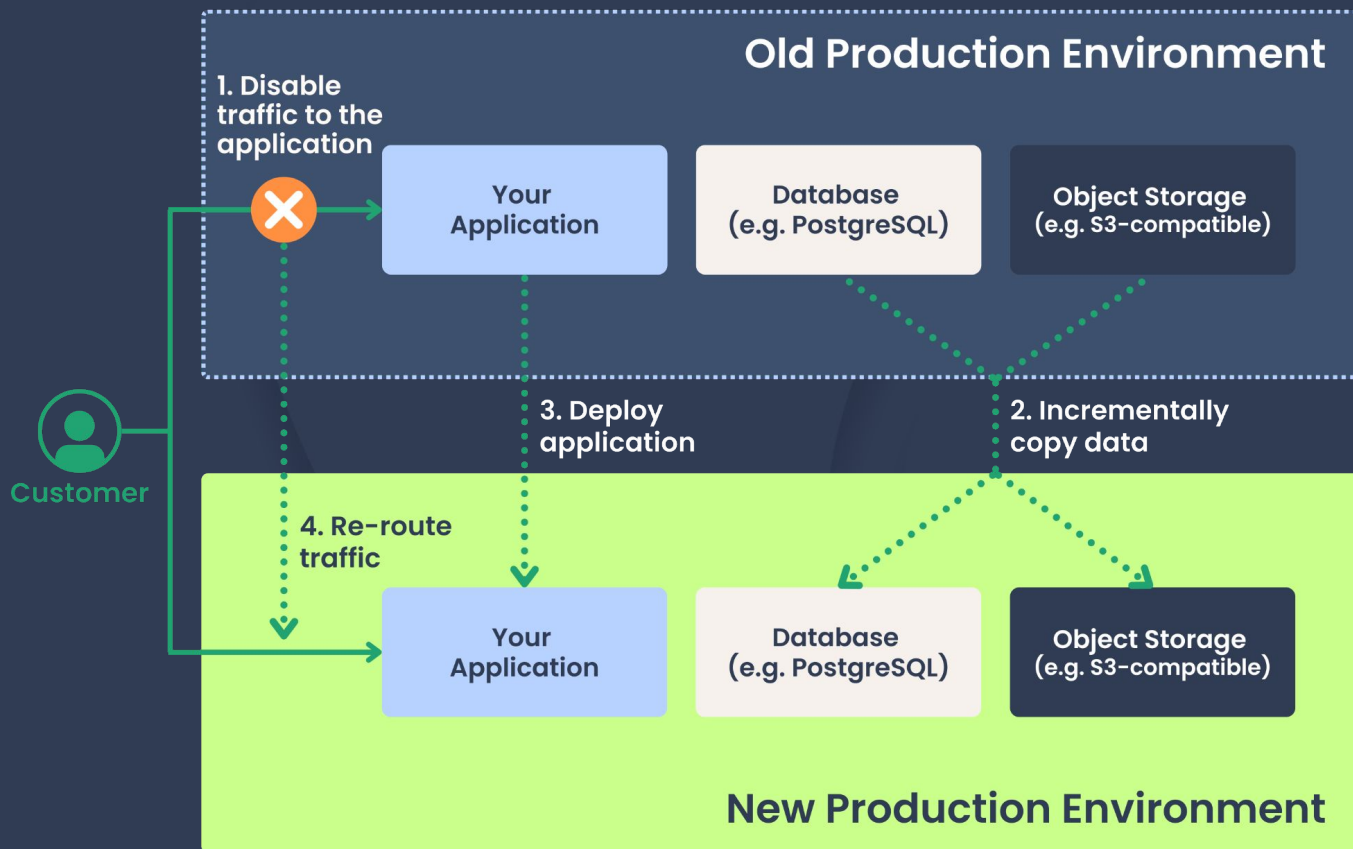

- Fill in Section 2 “Migration Execution”
- Aim for “just enough code” to de-risk the migration process
- Make it fit within the maintenance window, but not more!

Learn

Build

Measure

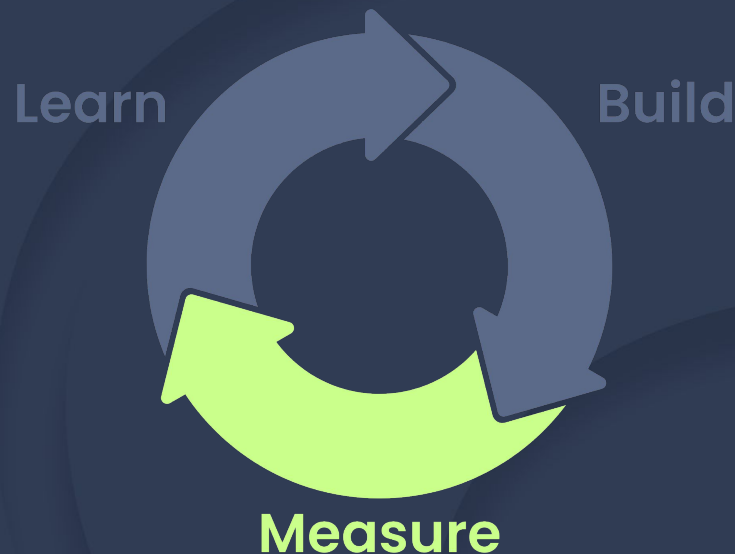

Measure

- Perform the migration against staging environment
- Mindset: “Airline captain”, not “Certified Kubernetes Administrator”
- **Consider timing!** Is migration going to fit in the migration window?

Learn

- Any steps missing? Add them to “2. Migration Plan”.
- Will the real migration be as simple as replacing “staging” with “new production”?
- Are any steps too tricky? Codify them!
- Something feels risky? Add checks to “3. Post-Migration Phase”.
- Can you further reduce the “downtime window”?
- What about rollback? Add to “4. Rollback Plan”

IF YES, THEN GOTO 10

- Consider getting another round of reviews / approvals.

Learn

Build

Measure

2. Migration Execution

2. Migration Execution

When did this section appear?

Pre-Migration / Build (drafted and reviewed)

- ☒ **Notifying internal stakeholders**
- ☐ Disabling traffic to the old application
- ☐ Copy over new data
- ☐ Deploy your application to the new production environment
- ☐ Re-route traffic to the new production environment
- ☐ Do a few tests
- ☐ **Notify internal stakeholders that migration is completed.**

And then...

...meditate for
2 minutes

3. Post-Migration Phase

3. Post-Migration Phase

When did this section appear?

- 0. Plan Migration (initial scaffold)
- 1. Pre-Migration / Build (drafted)
- 2. Migration Execution (potentially improved)

What does it include?

- Testing
- Follow-ups
- Deprecation and removal

Testing

- ❑ Let QA do ... QA
- ❑ Check analytics, logs, metrics for decrease in usage / increase errors
- ❑ Check with your key customer
- ❑ Check status of other applications

Testing

- ☒ Let QA do ... QA
- ☒ Check analytics, logs, metrics for decrease in usage / increase errors
- ☒ Check with your key customer
- ☒ Check status of other applications

Follow-ups

- ☒ Reconfigure your CI/CD pipeline
- ☒ Check if backups are still working
- ☐ Check if the Extract, Transform and Load (ETL) still works

Deprecation and Removal – Why?

Avoid confusion

GDPR “right to be forgotten”

Reduce unnecessary costs

4. Rollback Plan

"Failure to prepare is preparing for failure"

4. Rollback Plan

Why have a rollback plan?

1. It forces the migration plan to be written with rollback and risk minimization in mind.
2. It allows all stakeholders to agree on what to do if unforeseen circumstances require the migration to be aborted.

When did this section appear?

0. Plan Migration (initial scaffold)
1. Pre-Migration / Build (drafted and reviewed)

"After migration is before migration"

Lessons Learned

Knowledge sharing

"Selling" your hard work internally

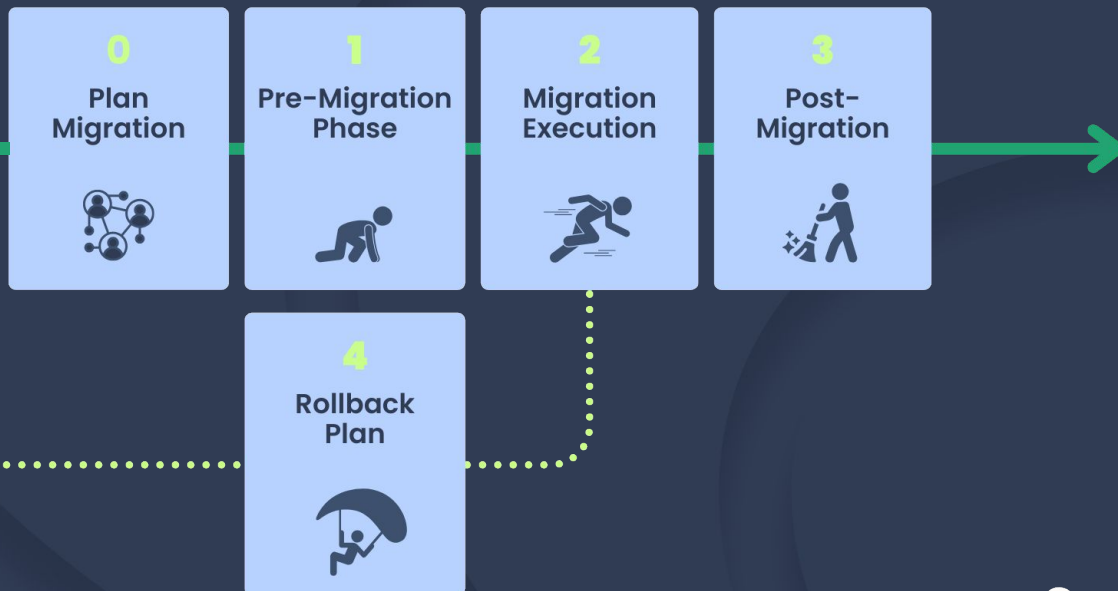

Making future migrations easier

TL;DR

2025 is weird.
Prepare to migrate
workloads. You'll
thank yourself later!

→ Go from “migration anxiety”
to “migration ... done” 😊

Thank You for Listening!
